Description			
<p>inside package there is a note to not use pbEOF property anymore.. and use BinaryEndOfFile function instead.</p> <p>But, There are some functions that still sets pbEOF, instead of setting the private structured member value for the file-handle array.</p> <p>BinaryFileReadUChar</p> <pre>If (iBytesRead = 0 or iBytesRead <> iNumberOfBytes) Begin Set pbEOF to True</pre>			
<p>Shouldn't it be setting the bEndOfFile member from the array plsFile property ?</p> <pre>Struct structFile Handle hFilehandle String sFilename // Assigned filename in OEM format. Boolean bEndOfFile // True then the end of the binary file had been read. End_Struct</pre>
