Summary

0000021: Code complete on find eq by crashes with mertech driver

Description

If you try to use code complete on "find eq by " then you first get the driver popup, immediately followed up by a crash.

The trick was to move the autologin popup from the editing phase to have it popup when selecting the workspace.

On selecting workspace (or starting the Hammer and thus selecting last workspace) we now enumerate the files in the filelist and if one file has a non DataFlex driver we will try to open the file.

That will then trigger the driver popup and the crash no longer happens while editing.

This however moved the crash to a "crash on close" .. a lot better, but we now also unload any driver before closing the program. Which as a result also removes the crash on close completely.
