The Database Update Framework - Suggestion #81

Allow for limiting the error log to only show errors (ie: filtering out WARNING)

Description

After running several iterations to get a migration program just right, the error log has several lines like this...

WARNING! Function: ApiTableConvertToSQL_Ex. The table ENTITY pointed to an embedded table in Filelist.cfg that already existed as an SQL table! The existing SQL table was renamed to: ENTITY_2A2E6A14-0F0D-4D22-9501-BF8AE840FD16 and then converted again.

I'd like to be able to set a property (or some such) to exclude these from the log file.

Just an idea (not sure if good or not), but maybe write out an ERROR log and a WARNING log file.
